

Summer Green Team Climate Care: 12 weeks Questions to Ponder and Act Upon

Week 3 of Summer Creation Care: Climate Science

There is a very strong scientific consensus that climate change is real. While the earth goes through natural warming and cooling cycles, in the past these changes take place over thousands of years. But the current warming is not “natural” given the unprecedented speed of the temperature rise. Human activities are the key drivers. The burning of fossil fuels, deforestation, and harmful farming practices increases CO₂ and other greenhouse gases in the atmosphere which harms the earth.

Questions to ponder and act upon:

- Where do you see the signs of climate change happening in your community?
- How could knowing the basics about climate science help in our advocacy work? Practice explaining the science behind climate change to someone in 2 minutes.
